Assessment Service Bulletin Number 6

Calculating Discrepancies Between the WJ III GIA-Std Score and Selected *WJ III* *Tests of Cognitive Abilities* Clusters

Fredrick A. Schrank, PhD, ABPP

Kevin S. McGrew, PhD

Richard W. Woodcock, EdD, ABPP

This bulletin outlines a step-by-step procedure for calculating discrepancies between the Woodcock-Johnson III (WJ III) General Intellectual Ability–Standard (GIA-Std) score and selected WJ III Tests of Cognitive Abilities clusters. It includes a reproducible worksheet for calculating these discrepancies. Tables of predicted CHC cluster scores, which were calculated based on the correlations between the measures and corrected for regression to the mean (Bloomers & Forsyth, 1977), are included. To determine the statistical significance of the discrepancy, the worksheet includes a calculation that uses the standard error of estimation (SEE) of the discrepancy score distribution, which is the appropriate standard deviation (SD) to use for this purpose.

Calculating Discrepancies Between the WJ III GIA-Std Score and Selected *WJ III Tests of Cognitive Abilities Clusters*

The *WJ III Tests of Cognitive Abilities* (WJ III COG) (Woodcock, McGrew, & Mather, 2001) consists of 20 tests that measure general intellectual ability and several broad and narrow cognitive abilities. Interpretation guidelines from the *WJ III COG Examiner's Manual* (Mather & Woodcock, 2001) suggest use of the intra-cognitive discrepancy procedures to help identify cognitive (or information processing) strengths and weaknesses. In these procedures, each cluster score is compared to an expected score that is predicted from the average of all of the other clusters in the comparison and corrected for regression. These calculations are automated in the *WJ III Compuscore® and Profiles Program* (Schrank & Woodcock, 2003). There are two intra-cognitive discrepancy procedures. To obtain the Intra-Cognitive–Standard discrepancy scores, Tests 1 through 7 must be administered. To obtain the Intra-Cognitive–Extended discrepancy scores, Tests 1 through 7 and 11 through 17 must be administered. The Intra-Cognitive–Extended discrepancy procedure is the most useful for this purpose, because it compares seven CHC broad abilities, each measured by two qualitatively different tests. The pattern of strengths and weaknesses identified by these procedures can be used to help identify the primary cognitive processing correlates of a learning disability.

However, for some purposes, such as selective testing, examiners may wish to calculate a discrepancy between an individual's general intellectual ability (GIA-Std) score and one or a few broad CHC factor scores. This procedure is not automated in the *WJ III Compuscore and Profiles Program*. To perform this discrepancy comparison accurately, examiners will need to (1) obtain an expected score that accounts for the effect of regression to the mean, (2) calculate the difference between the obtained and expected cognitive cluster standard scores (SS), and (3) use the standard error of estimate (SEE) to evaluate the statistical significance of the resulting GIA-Std/cognitive cluster discrepancy score.

All expected scores must be estimated with a procedure that corrects for regression to the mean. Correction for regression to the mean is necessary whenever the correlation between two measures is not perfect. If the expected score is based on a procedure that does not correct for regression to the mean, the obtained discrepancy score will be inaccurate and will lead to biased predictions and inaccurate placement decisions. Discrepancy scores based on a procedure that does not account for regression to the mean will identify too many significant discrepancies for students with high GIA-Std scores and will identify too few significant discrepancies for students with low GIA-Std scores. Correcting for regression eliminates this over- and under-identification bias. Additionally, the magnitude of the underestimate will differ depending on the specific WJ III cognitive CHC cluster that is being compared to the GIA-Std score. This difference occurs because correlations vary across clusters and for the same cluster as a function of age.

The *SEE*, not the *SD* of the individual measures, must be used to determine the statistical significance of the discrepancy. Sometimes, assessment professionals calculate discrepancies between two measures using a simple point difference, such as 15 or 22 points. This practice is based on an incorrect assumption that 15- and 22-point discrepancies represent 1.0 and 1.5 standard deviations in the distribution of discrepancy scores. However, the standard deviation of the discrepancy score distribution (*SEE*) is smaller than the standard deviation of either of the individual measures (*SD*).

Table 1 presents the *SEE* values that should be used when comparing a particular WJ III CHC cluster score to the predicted score based on the GIA-Std score. These values range from 8.2 to 13.5. Note that the *SEE* values differ by cluster and age. Note also that the *SEE* values are not equal to the *SD* of the tests. For example, a one-*SEE* difference between the predicted and obtained Fluid Reasoning score for an 8-year-old is represented by 9.2 SS points.

Table 1.
SEE Values for WJ III Cognitive Clusters by Age Group

Cognitive Cluster	Age Group			
	6–8	9–13	14–19	20–29
Comprehension-Knowledge	10.0	9.7	9.4	9.2
Long-Term Retrieval	10.3	11.0	10.0	9.4
Visual-Spatial Thinking	13.5	13.2	12.2	11.6
Auditory Processing	12.3	12.3	11.6	10.4
Fluid Reasoning	9.2	9.2	8.8	8.2
Processing Speed	11.5	12.3	11.9	11.1
Short-Term Memory	10.3	10.7	10.0	10.0
Phonemic Awareness	12.1	12.2	11.3	10.3
Working Memory	9.6	10.0	9.6	9.2
Cognitive Fluency	13.2	13.5	12.8	12.2

Tables 2 to 5 present the predicted scores for each of ten selected CHC factor scores given a specific WJ III GIA-Std score. Because the correlations from which these values are obtained vary by age, there are four tables. Table 2 contains the expected scores for subjects ages 6 to 8. Table 3 contains the expected scores for subjects ages 9 to 13. Table 4 contains the expected scores for subjects ages 14 to 19. Table 5 contains the expected scores for subjects ages 20 to 39.

Table 6 provides the necessary information to evaluate the significance of a discrepancy. This table shows the relationship of *SEE* scores (*z*) to the percentage of the population that will be identified as having a significant discrepancy.

Procedures for Calculating Discrepancies between the GIA-Std and Selected WJ III COG Cluster Scores

To calculate discrepancies between the WJ III GIA-Std and selected WJ III COG cluster scores, use the worksheet provided on page 13 and follow these steps.

1. Record the WJ III GIA-Std score in the blank at the top right corner.
2. In Column 2, record the obtained standard scores for any of the WJ III COG clusters listed in Column 1.

3. Locate the Predicted Cluster Standard Score table (Table 2, 3, 4, or 5) for the subject's age.
4. Locate the WJ III GIA-Std score in the left column of the correct table. The columns to the right show the predicted WJ III COG cluster standard scores based on the obtained GIA-Std score. Record the predicted score for each cluster being compared in Column 3 Predicted Cluster Score.
5. Subtract the Predicted Cluster score(s) from the Actual Cluster score(s) and record these values, including the correct sign (+ or -) Column 4 SS Difference.
6. Locate the correct *SEE* value from Table 1 and record that value in Column 5 *SEE*.
7. Divide the value(s) in Column 4 SS Difference by the values in Column 5 *SEE*.
8. Record the resulting values in Column 6 Discrepancy *SD*. The Discrepancy *SD* is a standardized z score that expresses the discrepancy in standard deviation units such as +/- 1 or 1.5 *SD*. Use Table 6 to evaluate the significance of the discrepancy.

WJ III GIA-Std/WJ III Cognitive Cluster Discrepancy Calculation Worksheet

Name _____

Age _____

WJ III GIA-Std _____

Column 1 WJ III CHC Clusters	Column 2 Actual Cluster Score	Column 3 Predicted Cluster Score (Table 2, 3, 4, or 5)	Column 4 SS Difference (+ or -)	Column 5 <i>SEE</i>	Column 6 Discrepancy <i>SD</i> (+ or -)
Comprehension-Knowledge	<input type="text"/>	<input type="text"/> – <input type="text"/> = <input type="text"/>	÷ <input type="text"/> = <input type="text"/>		
Long-Term Retrieval	<input type="text"/>	<input type="text"/> – <input type="text"/> = <input type="text"/>	÷ <input type="text"/> = <input type="text"/>		
Visual-Spatial Thinking	<input type="text"/>	<input type="text"/> – <input type="text"/> = <input type="text"/>	÷ <input type="text"/> = <input type="text"/>		
Auditory Processing	<input type="text"/>	<input type="text"/> – <input type="text"/> = <input type="text"/>	÷ <input type="text"/> = <input type="text"/>		
Fluid Reasoning	<input type="text"/>	<input type="text"/> – <input type="text"/> = <input type="text"/>	÷ <input type="text"/> = <input type="text"/>		
Processing Speed	<input type="text"/>	<input type="text"/> – <input type="text"/> = <input type="text"/>	÷ <input type="text"/> = <input type="text"/>		
Short-Term Memory	<input type="text"/>	<input type="text"/> – <input type="text"/> = <input type="text"/>	÷ <input type="text"/> = <input type="text"/>		
Phonemic Awareness	<input type="text"/>	<input type="text"/> – <input type="text"/> = <input type="text"/>	÷ <input type="text"/> = <input type="text"/>		
Working Memory	<input type="text"/>	<input type="text"/> – <input type="text"/> = <input type="text"/>	÷ <input type="text"/> = <input type="text"/>		
Cognitive Fluency	<input type="text"/>	<input type="text"/> – <input type="text"/> = <input type="text"/>	÷ <input type="text"/> = <input type="text"/>
